Overdispersion per library. Solid: typical (fitted trend; black over the bin medians (dots) it is fitted to, blue where extrapolated).
Cutoffs (max of the tier's floor and the chance level): dotted weak (FDR 50%), dashed moderate (10%), dash-dot strong (1%).
Points, light to dark orange: weak, moderate, strong; panel titles: genes per tier (weak / moderate / strong), false positives of the weak tier in a simulation.
